B530-A-% rCV

The graph displays the daily count of COVID-19 cases in the United States. The data begins in late October with a low number of cases. A significant surge occurs in early November, reaching a peak of nearly 100,000 cases. After this peak, the case count drops precipitously and remains at a low level, with minor fluctuations, until April. A vertical dashed red line is positioned at the start of the data series in late October.

The graph displays the daily number of COVID-19 cases in the United States. The y-axis is labeled 'Number of cases' and ranges from 0 to 100,000 in increments of 20,000. The x-axis is labeled 'Date' and shows months from Oct to Apr. A red dashed vertical line is positioned at the start of November 2020, indicating the beginning of the vaccination campaign. The data shows a period of relative stability with minor fluctuations between 10,000 and 30,000 cases from October to late March. A sharp, massive spike occurs in early April 2021, with cases reaching approximately 95,000. Following this peak, the number of cases drops sharply and remains relatively low, fluctuating between 5,000 and 15,000 through April.

The graph displays the daily number of COVID-19 cases in the United States from October to April. The y-axis represents the number of cases, with major grid lines at 0, 10, 15, and 20. The x-axis shows the months from October to April. A red dashed vertical line is positioned at the end of November, indicating the start of the second wave. The data shows a period of relative stability and low case counts from October through November. Following the red line, there is a sharp increase in cases, peaking at approximately 14 in early December. This is followed by a decline and then a second, even sharper spike in early April, where the number of cases exceeds 20. The graph illustrates the progression of the second wave and the subsequent surge in cases.
