The graph displays the daily count of COVID-19 cases in the United States. The data points are connected by a solid black line. Two vertical red dashed lines mark specific dates: one in early August and another in early November. The case count starts around 20,000 in July, peaks at nearly 80,000 in early August, then declines to around 20,000 by September. It remains relatively stable with minor fluctuations until November, after which it shows a slight downward trend. A very sharp spike occurs in early April, reaching over 100,000 cases, before returning to the baseline level.

The graph displays the daily number of COVID-19 cases in the Netherlands from July to April 2020. The y-axis represents the number of cases, ranging from 0 to 20. The x-axis represents time, with labels for July, October, January, and April. The data shows a significant peak in late July, followed by a sharp decline in late August. A period of relative stability with minor fluctuations occurs between September and November, with case counts generally between 7 and 14. A major spike is observed in late November, reaching over 20 cases. Following this, the number of cases drops and remains relatively low, fluctuating between 6 and 8 cases from January through April. Two vertical dashed red lines indicate the dates of the first and second nationwide lockdowns.
