B530-A-% rCV

The graph displays the daily number of COVID-19 cases in the Netherlands from November to April. The y-axis represents the number of cases, with major grid lines at 0, 2,000, 4,000, 6,000, 8,000, and 10,000. The x-axis shows the months from November to April. A blue line with circular markers tracks the daily case counts. A vertical dashed red line is placed at the end of December, marking the 'lockdown'. Before the lockdown, cases fluctuate between approximately 1,000 and 4,000. After the lockdown, there is a sharp drop to around 500 cases, followed by a period of low activity. A notable spike occurs in late February/early March, reaching nearly 10,000 cases, before returning to low levels.

The graph displays the percentage of relative coefficient of variation (%rCV) over a period from late October to late April. The y-axis is labeled '%rCV' and ranges from 5 to 20. The x-axis shows months: Nov, Dec, Jan, Feb, Mar, Apr. A vertical dashed red line is positioned at approximately November 20. Before this line, the %rCV values are high and fluctuate significantly, ranging from about 11 to 21. After the dashed line, the values drop sharply to around 6 and remain relatively low and stable, with a notable spike to 20 in early March.

The graph displays the percentage of relative coefficient of variation (%rCV) over time. The y-axis is labeled '%rCV' and ranges from 0 to 25. The x-axis shows months from November to April. A vertical dashed red line is positioned at approximately November 25. Before this line, the %rCV values are generally higher, fluctuating between 15 and 25. After the line, the values drop significantly, mostly staying below 10, with a prominent spike to over 25 in early March.

The graph displays the daily number of COVID-19 cases in the Netherlands. The y-axis is labeled 'Number of cases' and ranges from 0 to 10,000. The x-axis shows months from November to April. A red dashed vertical line is positioned at the beginning of December, indicating the start of the second wave. The data shows a first wave peaking in late November at approximately 8,000 cases, followed by a decline. A second, much larger wave begins in early December, peaks in late February/early March at over 10,000 cases, and then declines again by April.

The graph displays the daily number of COVID-19 cases in the Netherlands from November to April. The y-axis represents the number of cases, ranging from 0 to 20. The x-axis represents the month, with labels for Nov, Dec, Jan, Feb, Mar, and Apr. A red dashed vertical line is positioned at the beginning of December, indicating the start of the second wave. The data shows a period of relative stability in November, followed by a sharp increase in early December. The number of cases remains relatively low through January and February, with a significant spike in early March, reaching over 20 cases, before declining again in April.
