The graph displays the daily number of COVID-19 cases in the United States from September to April 2020. The y-axis represents the number of cases, ranging from 0 to 15. The x-axis represents time, with labels for October, January, and April. A vertical dashed red line indicates the date of the first case in the United States (January 20, 2020). The data shows a period of low case counts from September to late October, followed by a steady increase through November and December. A sharp peak occurs in early 2020, reaching approximately 15 cases. This is followed by a rapid decline to near-zero levels by late 2020, with a subsequent rise in late 2020, peaking again at approximately 15 cases in early 2021, before declining once more.

The graph displays the daily number of COVID-19 cases in the Netherlands from September 2019 to April 2020. The y-axis is labeled 'Number of cases' and ranges from 0 to 15. The x-axis is labeled 'Time' and shows months from Oct to Apr. A vertical dashed red line is positioned at the beginning of March 2020, indicating the start of the nationwide lockdown. The data shows a period of low case counts (mostly below 5) from September to early February. Starting in early March, the number of cases rises sharply, reaching a peak of approximately 14.5 in late March. Following the peak, there is a rapid decline, with cases falling back to around 7 by early April. The graph then shows a period of relative stability, with case counts fluctuating between 6 and 8 through April.
