B530-A-% rCV

The graph illustrates the progression of COVID-19 cases in the Netherlands. The first wave peaks in late November/early December at approximately 8,000 cases. A vertical dashed red line indicates the start of the second wave in late December. The second wave peaks in early March at nearly 10,000 cases. Following this peak, there is a period of relative stability with minor fluctuations, followed by a sharp increase in late April, reaching about 7,000 cases.

The graph displays the daily number of COVID-19 cases in the Netherlands. The y-axis is labeled 'Number of cases' and ranges from 0 to 10,000 in increments of 2,000. The x-axis shows months from November to April. A red dashed vertical line is positioned at the beginning of December, indicating the start of the second wave. The data shows a first wave peaking in late November at around 4,000 cases, followed by a decline. The second wave begins in early December, peaks in late February/early March at approximately 10,000 cases, and then declines again towards April.

The graph displays the daily count of COVID-19 cases in the United States. The data shows a period of fluctuation between 6 and 14 cases from November through early December. A red dashed line at approximately December 7th indicates the onset of the lockdown. Following this, the case count drops to a low level, generally between 2 and 4 cases, with a notable exception: a sharp spike to over 20 cases in early March. After this peak, the cases return to the low-level fluctuation pattern seen in the lockdown period.
