The graph displays the daily number of COVID-19 cases in the United States. The y-axis is on a logarithmic scale, with major ticks at 100,000 and 1,000,000. The x-axis spans from October to April. A red dashed vertical line is positioned at the end of December. The data shows a period of relative stability with minor fluctuations until late December, followed by a period of low case counts. A massive spike occurs in early April, with cases exceeding 1,000,000, before declining and then showing a slight upward trend towards the end of the period.

The graph displays the daily count of COVID-19 cases in the United States. The y-axis is labeled with values 0, 10, 15, and 20. The x-axis is labeled with months: Oct, Jan, and Apr. A red dashed vertical line is positioned at the end of December. The data shows a period of fluctuating case counts between 5 and 15 from October through late December. A sharp increase occurs in early January, with a peak of approximately 21 cases. Following this peak, the case counts drop significantly and remain relatively low, mostly below 10, through April.
