The scatter plot displays the daily number of cases over time. The y-axis is labeled with values 0, 20, 40, 60, 80, and 100. The x-axis is labeled with the months Nov, Dec, Jan, Feb, Mar, and Apr. A vertical dashed red line is positioned at the end of December. Data points are plotted for each day, showing a sharp increase in cases starting in early January, peaking in mid-January, and then fluctuating at a high level through February and March.

[illegible]

The graph displays the daily count of COVID-19 cases in the United States. The x-axis is labeled with months: Nov, Dec, Jan, Feb, Mar, and Apr. The y-axis represents the number of cases, with a grid extending up to 100,000. A vertical dashed red line is positioned at the beginning of the data series in early December. The data shows a significant rise in cases starting in late December, reaching a peak of approximately 100,000 cases in early January. Following this peak, the number of cases declines steadily through February and March, with a notable spike in late March reaching about 20,000 cases before settling back down in April.

The graph displays the daily number of COVID-19 cases in the Netherlands. The data shows a first wave peaking in late December at approximately 10,000 cases. A vertical dashed red line indicates the start of the second wave in early December. The second wave peaks in early March at approximately 10,000 cases, followed by a decline and a subsequent rise in early April, indicating a third wave.

The graph displays the daily number of COVID-19 cases in the Netherlands. The data shows a first wave peaking in late December at approximately 10,000 cases. After a period of low activity, a second wave begins in early March, reaching a peak of about 5,000 cases in early April. A red dashed line is positioned at the start of the second wave in early December.

The graph displays the daily count of COVID-19 cases in the United States. The x-axis is labeled with months: Nov, Dec, Jan, Feb, Mar, and Apr. The y-axis represents the number of cases, with a grid of horizontal lines. A vertical dashed red line is positioned at the beginning of the data series in early December. The data shows a period of low case counts from late December through February. Starting in late February, there is a rapid and significant increase in cases, reaching a peak in early March. Following the peak, the number of cases begins to decline, showing some fluctuations, but remains higher than the initial period of the data series.

The graph displays the daily number of COVID-19 cases in the Netherlands from November to April. The y-axis represents the number of cases, ranging from 0 to 20. The x-axis shows the months: Nov, Dec, Jan, Feb, Mar, and Apr. A red dashed vertical line is positioned at the end of December, indicating the start of the second wave. The data shows a period of relative stability in November and early December, followed by a sharp decline in late December. A significant peak occurs in early March, reaching over 20 cases, before declining again in April.
