The scatter plot displays daily death tolls in the US. The y-axis scale is 0 to 100. The x-axis spans from September to April. Two vertical dashed red lines are positioned at approximately September 15 and November 15. The data shows a period of low mortality from September to mid-November, followed by a sharp increase in deaths starting in early December, peaking in early January at nearly 100 deaths per day, and then gradually declining through April.

The scatter plot displays daily COVID-19 deaths in the US. The y-axis scale is 0 to 100. The x-axis shows months from September to April. A red dashed line marks October 23, 2020. Data points are black dots. Before the red line, there is one outlier at approximately 60 deaths in early September, and a cluster of points near zero deaths from late September to mid-October. After the red line, there is a sharp increase in deaths, with a peak of approximately 90 deaths in early January, followed by a decline and then a slight increase again in late January and early February.

The graph displays the percentage of relative coefficient of variation (%rCV) over time. The y-axis is labeled '%rCV' and ranges from 0 to 30. The x-axis shows months from July to April. Two vertical dashed red lines are positioned at approximately August 15 and November 15. The data points are connected by a blue line. The first half of the period (before the first dashed line) shows significant fluctuations, with peaks reaching 20% and 30%. The second half (after the first dashed line) shows much lower variability, with most values below 10% and a notable spike to about 17% in late March.
