The scatter plot displays daily COVID-19 cases. The y-axis is labeled with values 0, 20, 40, 60, 80, and 100. The x-axis is labeled with months: Nov, Dec, Jan, Feb, Mar, and Apr. A vertical dashed red line is positioned at the beginning of December. Data points are black dots. In November, cases are mostly below 20. In early December, there is a sharp increase to nearly 100 cases. From mid-December onwards, the number of cases remains consistently high, fluctuating between approximately 90 and 100 per day.

Month	Day	Tweets

The graph displays the percentage of relative coefficient of variation (%rCV) over time. The y-axis is labeled '%rCV' and ranges from 6 to 15. The x-axis shows months from October to April. A red dashed vertical line is positioned at the end of October. The data points are connected by a blue line. The %rCV starts around 9.5 in early October, fluctuates between 9 and 14 until late November, then peaks at approximately 18% in late November. After the red dashed line, it drops sharply to around 4% in December and remains relatively stable and low through April.

Month	%rCV (approximate values)
Oct	9.5, 9.2, 9.8, 9.5, 11.0, 9.0, 11.5, 8.8, 11.8, 14.0, 11.5, 10.5, 12.5, 11.0, 15.0, 12.5, 11.5, 14.0, 12.8, 15.0, 11.8, 15.5, 16.5, 17.5, 16.8

The graph illustrates the impact of the COVID-19 lockdown in the Netherlands. The number of daily cases was high and volatile before the lockdown, with peaks reaching nearly 10,000. Following the implementation of the lockdown in late October, the number of cases dropped dramatically and remained at a low level for the remainder of the period shown, with a significant spike in early March.

The graph displays the daily number of COVID-19 cases in the Netherlands. The data shows high volatility in late 2020, with a major peak in late December reaching nearly 10,000 cases. Following the lockdown, cases dropped significantly and remained at low levels until a small resurgence in early March.
