The graph displays the daily number of COVID-19 cases in the United States from October to April. The y-axis represents the number of cases, ranging from 0 to 1,000,000. The x-axis shows the months from October to April. A vertical dashed red line is drawn at the end of December, indicating the start of the sharp increase in cases. The data shows a significant rise in cases starting in late December, peaking in early January at approximately 1,000,000 cases, and then fluctuating at a high level through April, with a notable dip in late March followed by a sharp rise in early April.

The graph displays the daily number of COVID-19 cases in the United States from October to April. The y-axis represents the number of cases, ranging from 0 to 100,000. The x-axis shows the months from October to April. A vertical dashed red line is positioned at approximately November 11, 2019, indicating the date of the first case. The data shows a general upward trend with significant fluctuations, including a sharp spike in early April reaching nearly 100,000 cases.

The graph displays the daily number of COVID-19 cases in the United States from October to April. The y-axis represents the number of cases, and the x-axis represents time. A vertical dashed red line marks the start of the 'lockdown' period in late November. The graph shows a significant increase in cases during the lockdown, peaking in early January, followed by a sharp decline and a period of relative stability.

The graph displays the daily count of COVID-19 cases in the United States. The x-axis is labeled with months: Oct, Jan, and Apr. The y-axis represents the number of cases, with a grid indicating increments of 100,000. A vertical dashed red line is positioned at approximately November 1st. The data shows a period of relative stability and low case counts from October through early November. Following this, there is a period of significant volatility with several peaks, the highest reaching nearly 1,000,000 cases in late January. After this peak, the case counts drop sharply to around 100,000 by early February. From February onwards, the case counts remain relatively low, fluctuating between 50,000 and 100,000, with a notable spike back up to nearly 1,000,000 cases in late March.

The graph displays the daily number of COVID-19 cases in the United States. The y-axis is labeled 'Number of cases' and ranges from 0 to 100,000 in increments of 20,000. The x-axis is labeled 'Date' and shows months from Oct to Apr. A vertical red dashed line is positioned at the end of December 2020, indicating the start of the vaccination campaign. The data shows a period of relative stability with minor fluctuations until late March/early April 2021, when there is a sharp, massive spike in cases, peaking at approximately 95,000. Following this peak, the number of cases drops sharply and remains relatively low through April 2021.

The graph displays the daily count of COVID-19 cases in the United States. The y-axis is labeled with values 0, 10, 15, and 20. The x-axis is labeled with months: Oct, Jan, and Apr. A vertical dashed red line is positioned at approximately January 20, 2020. The data shows a period of low case counts from October 2020 through early January 2021, followed by a sharp increase starting in late January, peaking at over 20 cases in early February, and then declining with some fluctuations through April 2021.
