The graph displays the daily number of COVID-19 cases in the Netherlands from October to April. The y-axis represents the number of cases, with major grid lines at 0, 5,000, and 10,000. The x-axis shows the months from October to April. A red dashed vertical line is positioned at the beginning of December, indicating the start of the second wave. The data shows a first wave peaking in late October at approximately 8,000 cases, followed by a decline. The second wave begins in early December, rises to a peak of about 10,000 cases in late January, and then fluctuates with a slight downward trend towards April.

The graph displays the daily number of COVID-19 cases in the Netherlands from October to April. The y-axis represents the number of cases, ranging from 0 to 10,000. The x-axis shows the months from October to April. A vertical dashed red line is positioned at December 23rd. The data shows a period of low case numbers from October to late December, followed by a sharp increase starting around December 23rd. Cases peaked in early January at approximately 10,000, then fluctuated with a significant drop in late February, followed by a recovery and another peak in early April.

The scatter plot displays the daily number of COVID-19 cases in the Netherlands from November to April. The x-axis represents time, with labels for November, December, January, February, March, and April. The y-axis represents the number of cases, with a scale from 0 to 1000. A vertical dashed red line is positioned at the beginning of December, marking a significant point in time. The data points show a low number of cases (below 100) in November, followed by a sharp increase to over 1000 cases in early December. From mid-December onwards, the number of cases remains consistently high, fluctuating between approximately 1000 and 1500 cases per day.

The scatter plot displays daily case counts. A vertical dashed red line marks the beginning of December. Before this line, in November, the daily case counts are consistently low, around 10. After the line, in December and through April, the daily case counts are consistently high, around 90.

The graph displays the percentage of relative coefficient of variation (%rCV) over time. The y-axis is labeled '%rCV' and ranges from 6 to 15. The x-axis shows months from October to April. A vertical dashed red line is positioned at the end of November. The data points are connected by a blue line. The %rCV values are generally high (between 9 and 15) from October through early December, then drop sharply to around 5 in early December. There is a significant spike to approximately 18 in late February, followed by a return to values around 5 for the remainder of the period.

The graph illustrates the impact of the COVID-19 lockdown in the Netherlands. The y-axis represents the number of cases, and the x-axis represents time in months. A red dashed line indicates the lockdown period starting in late October. The data shows a significant reduction in case numbers following the lockdown, with a period of low activity from January to March, followed by a sharp increase in early March and a subsequent decline.

The graph illustrates the daily reported COVID-19 cases in the Netherlands. The data shows a period of fluctuating case counts from October through late December, followed by a sharp decline after the lockdown. A major peak is observed in early March, reaching nearly 10,000 cases, before a subsequent decline and a small resurgence in late April.
