Figure 1 is a scatter plot showing the time series of the difference between the estimated and true values of the parameter α . The y-axis ranges from -0.050 to 0.050. The x-axis shows months from October to April. Two vertical dashed red lines are drawn at approximately October 15 and November 15. The data points are clustered around zero, with a slight increase in variance after the second dashed line.

Scatter plot showing monthly mean precipitation (mm) for the period 1979-2019. The y-axis ranges from 28 to 33 mm. The x-axis shows months from Oct to Apr. A red dashed vertical line is at approximately Oct 1980. Data points are black dots. Most points are at 33 mm, with a few at 31.4 mm and 28.7 mm.

The graph displays the daily number of COVID-19 cases in the Netherlands. The y-axis is labeled 'Number of cases' and ranges from 0 to 20. The x-axis is labeled 'Time' and spans from April 2020 to April 2021. The data shows a rapid rise in cases in April 2020, peaking at approximately 15 cases. This is followed by a period of decline and then a relatively stable period with minor fluctuations. A significant spike in cases is visible in late 2020, reaching over 20 cases. Two vertical dashed red lines are present, one near the start and one near the end of the period.
