The graph displays the daily count of COVID-19 cases in the United States. The data begins in early December, indicated by a red dashed line. The case count remains relatively low, fluctuating between approximately 10,000 and 20,000 cases per day through January and February. A dramatic surge occurs in early March, with cases peaking at nearly 100,000. Following this peak, the case count drops sharply and then shows a gradual upward trend through April, ending at approximately 25,000 cases.

The graph displays the daily number of COVID-19 cases in the Netherlands from November to April. The y-axis represents the number of cases, ranging from 0 to 20. The x-axis shows the months: Nov, Dec, Jan, Feb, Mar, and Apr. A red dashed vertical line is positioned at the beginning of December, indicating the start of the second wave. The data shows a period of relative stability in November, followed by a rise in December. After the red line, there is a sharp decline in cases, followed by a period of low activity in January and February. A major spike occurs in early March, with cases exceeding 20. Following this peak, the number of cases remains relatively low and stable through April.
