The graph displays the daily count of COVID-19 cases in the United States. The data points are connected by a solid black line. A vertical dashed red line marks the end of December. The most prominent feature is a sharp spike in early March, where the number of cases reaches approximately 95,000. Before this spike, the case counts were relatively low, fluctuating between 10,000 and 20,000. After the spike, the cases dropped back to around 10,000 and then showed a slight upward trend towards the end of the period shown.

The graph displays the daily number of COVID-19 cases in the Netherlands from October to April. The y-axis represents the number of cases, ranging from 0 to 20. The x-axis shows the months from October to April. A vertical dashed red line is positioned at the beginning of December, indicating the start of the second wave. The data shows a period of relative stability in October and November, followed by a sharp increase in early December. The number of cases remains high through January and February, with a significant peak in early March, reaching over 20 cases. Following this peak, the number of cases drops sharply and remains low through April.
