The graph illustrates the progression of COVID-19 cases in the Netherlands. The initial wave peaks in late December at approximately 9,500 cases. Following the first lockdown, cases drop significantly. A second wave begins in early March, peaking at around 1,000 cases before declining again. The data shows a clear pattern of waves and subsequent declines, with the most significant drop occurring after the first lockdown.

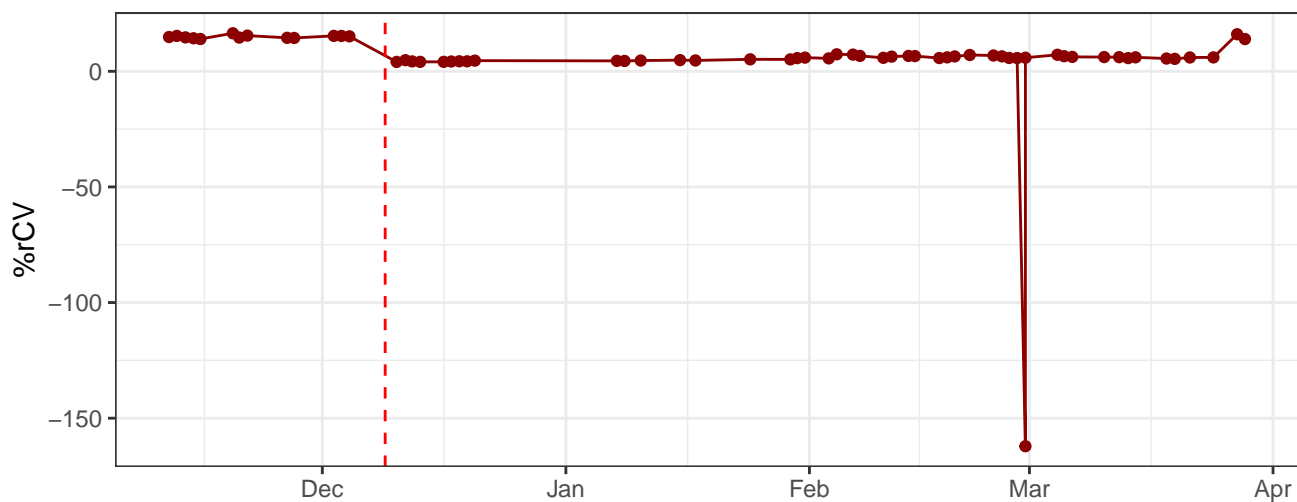

The graph illustrates the impact of the COVID-19 lockdown in the Netherlands. Before the lockdown (late December), the number of daily cases was high and volatile, with peaks near 100,000. Following the lockdown, there was a significant and sustained reduction in cases, with a notable spike in early March that was quickly followed by a return to low-level transmission.

The graph displays the daily number of COVID-19 cases in the United States. The x-axis is labeled with months: Dec, Jan, Feb, Mar, and Apr. The y-axis represents the number of cases, with a grid indicating increments of 100,000. A vertical dashed red line is positioned at approximately January 22, 2020, indicating the start of the epidemic. The data shows a period of low case counts from late December through late February, followed by a rapid and significant increase in cases, peaking in early March at over 1,000,000 cases, and then a gradual decline through April.
