The graph displays the percentage of relative coefficient of variation (%rCV) over a period from January to April. The y-axis is labeled '%rCV' and ranges from 5 to 20. The x-axis shows months: Feb, Mar, and Apr. The data is represented by a dark red line with circular markers at each data point. The values fluctuate significantly, with major peaks occurring around February 1st (approx. 18.5), February 10th (approx. 19), and March 1st (approx. 23.5). There are also several periods of lower values, particularly in early January and mid-March.

The graph displays the daily count of COVID-19 cases in the United States from January 1 to April 1, 2020. The x-axis represents time, with labels for February, March, and April. The y-axis represents the number of cases, ranging from 0 to 100,000. The data shows a highly volatile trend with multiple peaks and troughs. The highest peak occurs in late March, reaching nearly 100,000 cases. The lowest point is in late March, dropping to near zero cases. The overall trend shows a significant increase in cases starting in late February, peaking in late March, and then a sharp decline in early April.
