The graph displays the daily count of COVID-19 cases in the United States. The x-axis represents time, with labels for February, March, and April. The y-axis represents the number of cases, with a scale from 0 to 100,000. The data shows a significant rise in cases starting in late January, reaching a peak of approximately 100,000 cases in early February. Following this peak, the number of cases begins a steady decline, with some fluctuations, including a notable dip in mid-March followed by a slight recovery. By the end of April, the daily case count has decreased to around 20,000.

The graph displays the daily death toll in the UK during the early stages of the COVID-19 pandemic. The data is characterized by extreme daily fluctuations, with peaks often occurring in the early morning hours. A major peak is observed in early January, reaching nearly 115,000 deaths. Following this, there is a period of relative decline, with the death toll generally staying below 105,000 from mid-February onwards. However, the data remains highly volatile, with several smaller peaks and troughs throughout the period shown.
