The graph displays the daily count of COVID-19 cases in the United States from December to April. The x-axis represents time in months, and the y-axis represents the number of cases. A vertical dashed red line is positioned at the beginning of January, indicating a point of interest in the data trend. The data shows a significant peak in early January, followed by a period of relative stability and then a slight decline towards the end of the period shown.

The graph displays the daily count of COVID-19 cases in the United States. The data begins in early December with about 4.5 cases. It rises to a peak of approximately 12 cases in early January, then drops to around 2 cases by mid-January. A significant spike occurs in late February, reaching 15 cases, before returning to a low level of about 2 cases in early March and remaining stable through April.

Month	Day (approx.)	Cases (approx.)
Dec	10	4.5
Dec	15	6.5
Dec	20	8.0
Dec	25	11.0
Dec	28	10.0
Jan	1	12.0
Jan	5	6.0
Jan	10	3.0
Jan	15	2.5

The graph displays the daily count of COVID-19 cases in the United States. The y-axis is labeled with values 7.5, 10.0, 12.5, and 15.0. The x-axis is labeled with months: Dec, Jan, Feb, Mar, and Apr. A vertical dashed red line is positioned at the beginning of January. The data points are connected by a solid black line. The number of cases starts at approximately 12.5 in late December, drops to 10.0 in early January, then rises to a peak of about 14.0 in mid-January. Following the red line, cases drop sharply to around 6.5 in early January, then fluctuate between 6.5 and 8.0 through January. In early February, cases rise to a peak of 15.0, then drop to around 6.5. A second, much higher peak occurs in early March, reaching 15.0 cases, followed by a decline and then a resurgence in late March and early April, peaking again at approximately 15.0 cases in early April, before declining.
