The graph displays the daily count of COVID-19 cases in the United States. The x-axis represents time, with labels for February, March, and April. The y-axis represents the number of cases, with a scale from 0 to 100,000. The data shows a period of low case counts in January, followed by a rapid increase starting in late February. The number of cases peaks at approximately 100,000 in early March and then shows a general downward trend through April, with some fluctuations.

The graph displays the daily number of new COVID-19 cases in the United States from January 1 to April 1, 2020. The x-axis represents time, with labels for February (Feb), March (Mar), and April (Apr). The y-axis represents the number of cases, with a scale from 0 to 100,000. The data is plotted as a dark red line with circular markers at each data point. The graph shows a highly volatile trend with a major peak in late February/early March, reaching nearly 100,000 cases. There are several smaller peaks throughout the period, particularly in late January and late March. The overall trend shows a significant increase in cases starting in late January, peaking in early March, and then declining with some fluctuations through April.

The graph displays the daily count of COVID-19 cases in the United States. The x-axis represents time, with labels for February and March. The y-axis represents the number of cases, with a scale from 0 to 100,000. The data shows a period of low case counts (mostly below 10,000) from January 1 to late February. Starting in late February, there is a rapid increase in cases, with several peaks reaching between 40,000 and 60,000. The highest peak occurs in early March, reaching approximately 100,000 cases. Following this peak, the number of cases begins to decline, with some fluctuations, and shows a slight upward trend again in late March and early April, reaching around 40,000 cases by April 1.

The graph displays the percentage of rCV for R780-A over time. The y-axis, labeled '%rCV', ranges from 5 to 20. The x-axis shows the months of February, March, and April. The data is highly volatile, with a major peak in late February/early March reaching approximately 24%.

The graph displays the FSC-A-% rCV metric over time. The y-axis represents the percentage of rCV, ranging from 4 to 8. The x-axis shows the months from January to April. The data points are connected by a line, showing a highly variable trend with several peaks and troughs. Notable peaks occur in late January, late February, and late March, while significant troughs are seen in early February and late March.

The graph displays the FSC-H-% rCV metric over a period from January to April. The y-axis represents the percentage of rCV, ranging from 1.4 to 2.4. The x-axis shows the months. The data is characterized by frequent fluctuations, with values generally staying between 1.7 and 2.3, except for a sharp decline to around 1.42 in late March.
