The graph displays the daily count of COVID-19 cases in the United States. The data begins in early December with approximately 800,000 cases, which rapidly declines to around 100,000 by mid-December. The case count remains relatively stable and low through January and February, with a minor peak in early February. A massive surge occurs in early March, peaking at nearly 1,000,000 cases. Following this peak, the case count drops sharply and then shows a gradual upward trend through April, ending at approximately 200,000 cases.

The graph displays the daily count of COVID-19 cases in the United States. The data begins in early December with a high value (around 100,000 cases), which then drops sharply to near zero by mid-December. The case count remains very low through January and the first half of February. Starting in the second half of February, there is a significant and rapid increase in cases, reaching a peak of approximately 100,000 in early March. Following this peak, the number of cases declines but remains higher than the initial period, showing some fluctuations as it continues into April.

The graph displays the daily count of COVID-19 cases in the United States. The data begins in early December with approximately 100,000 cases. There is a period of relative stability with minor fluctuations until late February. A significant surge begins in late February, reaching a peak of over 1,000,000 cases in early March. Following this peak, the number of cases declines but remains elevated, showing a secondary rise in late April.
