The figure is a scatter plot with a connecting line, showing the daily number of COVID-19 cases from December to April. The y-axis is labeled 'Number of cases' and ranges from 0 to 100 in increments of 20. The x-axis is labeled with months: Dec, Jan, Feb, Mar, Apr. A vertical dashed red line is positioned at approximately December 15th. The data points are black dots connected by a solid black line, indicating a relatively stable number of cases around 20 per day throughout the period shown.

Figure 1 is a scatter plot showing the time series of the difference between the estimated and true values of the parameter  $\alpha$ . The x-axis represents time, with labels for Dec, Jan, Feb, Mar, and Apr. The y-axis represents the difference, ranging from -0.050 to 0.050. A vertical dashed red line is drawn at approximately December 15th. Data points are black dots clustered around zero.

The scatter plot displays the daily number of COVID-19 cases in the Netherlands from December to April. The y-axis, labeled 'Number of cases', ranges from 29 to 32. The x-axis shows the months: Dec, Jan, Feb, Mar, and Apr. A vertical dashed red line marks the end of December. The data shows a significant peak in late December (around 32.5 cases) followed by a sharp decline to approximately 28.5 cases in early January. From January onwards, the number of cases remains relatively low and stable, fluctuating slightly around 28.5 cases per day.

Month	Day (approx.)	Number of cases (approx.)
Dec	28	32.5
Dec	29	32.5
Dec	30	28.5
Jan	5	28.5
Jan	6	28.5
Jan	15	28.5
Feb	1	28.5
Feb	15	28.5
