The graph displays the daily count of COVID-19 cases in the United States. The data shows a period of relative stability with minor fluctuations in November and December, followed by a massive surge in early January. After a period of decline, a second, slightly smaller surge occurred in early February. The case counts then settled into a lower, more stable range for the remainder of the period shown.

The graph displays the daily count of COVID-19 cases in the United States. The data begins in early December, showing a period of high volatility with several peaks and troughs. A major peak occurs in early January, reaching approximately 100,000 cases. Following this, the case count generally declines but remains relatively high. A second, very sharp spike occurs in late February/early March, also reaching nearly 100,000 cases. By April, the case count appears to be stabilizing at a level around 20,000 cases.

The graph displays the daily count of COVID-19 cases in the United States. The data begins in early December, showing a period of relative stability around 10,000 cases. A sharp increase occurs in late December, peaking in early January at approximately 100,000 cases. This is followed by a decline and then a significant spike in late February/early March reaching nearly 100,000 cases, before a final decline in April.
