The graph displays the daily count of COVID-19 cases in the United States. The data begins in early December with approximately 100,000 cases. It shows a period of fluctuation with an upward trend, peaking at nearly 1,000,000 cases in early January. After a decline, there is a massive spike in late February/early March, reaching approximately 950,000 cases. Following this, the case counts drop and remain relatively stable, fluctuating between 100,000 and 200,000 cases through April.

The graph displays the daily count of COVID-19 cases in the United States. The data shows high volatility in late November and December, with a major peak exceeding 100,000 cases in late December. After a sharp decline indicated by the dashed red line, the case count remains relatively low and stable through January and February. A notable spike occurs in early March, reaching approximately 20,000 cases, before settling back into a low-level fluctuation through April.

The graph displays the daily count of COVID-19 cases in the United States. The data begins in early December, showing a period of relative stability followed by a sharp rise starting in late December. The peak occurs in early January, reaching approximately 100,000 cases. After a decline, there is a second, even sharper spike in late February/early March, also reaching nearly 100,000 cases. The data ends in April, showing a slight increase from the previous period.
