The graph displays the daily count of COVID-19 cases in the United States. The x-axis represents time, with labels for February, March, and April. The y-axis represents the number of cases, with a grid line at 100,000. The data shows a period of relative stability with minor fluctuations until late March, followed by a rapid and significant increase in cases, reaching a peak of over 200,000 in early April before a slight decline.

The graph displays the daily death toll in the United States during the early stages of the COVID-19 pandemic. The data shows high volatility in January and February, with a major peak in early March. Following this peak, there is a period of relative stability, with daily death counts fluctuating between approximately 130,000 and 150,000 through April.

The graph shows the gain over time for the 10th experiment. The gain is constant at 558.00 for most of the duration, but there are several sharp drops to 557.00. The drops occur at approximately 0.5, 1.5, 2.5, 3.5, 4.5, and 5.5 hours. The gain returns to 558.00 immediately after each drop.

Time (h)	Gain
