Figure 1 is a scatter plot showing the time series of the difference between the estimated and true values of the parameter α . The x-axis represents time, with labels for Dec, Jan, Feb, Mar, and Apr. The y-axis represents the difference, ranging from -0.050 to 0.050. A vertical dashed red line is drawn at approximately December 15th. Data points are plotted at regular intervals, showing a constant difference of 0.000 for most points, with a slight deviation around the dashed line.

The scatter plot displays the daily number of COVID-19 cases in the Netherlands from December to April. The y-axis, labeled 'Number of cases', ranges from 29 to 32. The x-axis shows the months: Dec, Jan, Feb, Mar, and Apr. A vertical dashed red line marks the end of December. The data shows a significant peak in late December (around 32.5 cases) followed by a sharp decline to approximately 28.5 cases in early January. From January onwards, the number of cases remains relatively stable and low, fluctuating slightly around 28.5 cases per day.

Month	Day (approx.)	Number of cases (approx.)
Dec	28	32.5
Dec	29	32.5
Dec	30	28.5
Jan	5	28.5
Jan	6	28.5
Jan	15	28.5
Feb	1	28.5
Feb	15	28.5

The graph displays the daily count of COVID-19 cases in the United States. The data shows a period of low activity from late December through February, followed by a massive surge in early March. After the peak, the case count drops significantly and then shows a slight upward trend as the month of April begins.

The graph displays the daily number of COVID-19 cases in the Netherlands from November to April. The y-axis represents the number of cases, ranging from 0 to 20. The x-axis represents time in months, with labels for Dec, Jan, Feb, Mar, and Apr. A red dashed vertical line indicates the start of the first lockdown in late November. The data shows a peak in late November, followed by a decline during the first lockdown. A second peak occurs in late February, followed by a decline during the second lockdown. The data ends in early April.
