B530-A-% rCV

The graph displays the daily number of COVID-19 cases in the United States from October to April. The y-axis represents the number of cases, and the x-axis represents time. A vertical dashed red line marks the start of the 'lockdown' period in late November. The graph shows a significant increase in cases during the lockdown, peaking in early January, followed by a sharp decline and a period of relative stability.

The graph displays the daily count of COVID-19 cases in the United States. The x-axis is labeled with months: Oct, Jan, and Apr. The y-axis represents the number of cases, with a grid extending to 100,000. A red dashed vertical line is positioned at approximately November 1st. The data shows a period of high volatility and growth from late October to early January, peaking at nearly 100,000 cases. Following this peak, there is a rapid decline to around 10,000 cases by mid-January. The case count remains relatively low and stable through February and March, with a notable spike to approximately 20,000 cases in late March before returning to the baseline.

The graph displays the daily number of COVID-19 cases in the United States. The y-axis is on a logarithmic scale, with labels at 100,000 and 1,000,000. The x-axis spans from October to April. A vertical dashed red line is positioned at the end of December. The data shows a significant peak in early January, exceeding 1,000,000 cases, followed by a period of relative stability and then a slight upward trend towards the end of the period shown.

The graph displays the daily number of COVID-19 cases in the United States from October to April. The y-axis represents the number of cases, with major grid lines at 0, 10, 15, and 20. The x-axis shows the months from October to April. A red dashed vertical line is positioned at the end of November, indicating the start of the second wave. The data shows a period of relative stability and low case counts from October through early November, followed by a period of increasing case counts through December. A sharp spike occurs in early April, reaching a peak of over 20 cases, before declining again.
