The graph displays the daily number of COVID-19 cases in the United States from September to April. The y-axis represents the number of cases, and the x-axis represents time. A vertical dashed red line marks the date of the first case in the United States (January 20, 2020). The graph shows a sharp increase in cases starting in late March, peaking in early April, and then declining.

The graph displays the daily number of COVID-19 cases in the Netherlands. The y-axis is labeled 'Number of cases' and ranges from 0 to 10,000. The x-axis shows the months from October to April. A vertical dashed red line indicates the start of the lockdown in November. The data shows a sharp initial peak in late September, followed by a period of relative stability with minor fluctuations. A significant increase is observed in late November and December, reaching a peak of nearly 10,000 cases. Following the lockdown, the number of cases drops dramatically and remains at a low level until a small spike in late March.

The graph displays the daily count of COVID-19 cases in the United States. The data shows a period of low case counts from late September through late December. A major surge begins in early January, peaking at approximately 95,000 cases. This is followed by a rapid decline and a period of relative stability with minor fluctuations through April.

The graph displays the daily number of COVID-19 cases in the Netherlands. The y-axis is labeled 'Number of cases' and ranges from 0 to 20. The x-axis shows months from September to April. A vertical dashed red line is positioned at the end of November, indicating the start of the second wave. The data shows a first wave peaking in late November, followed by a decline and then a second, much larger wave peaking in early January.
