The line plot displays the daily number of COVID-19 cases in the United States from August 1, 2020, to April 1, 2021. The x-axis represents time, with labels for October, January, and April. The y-axis represents the number of cases, with a scale from 0 to 100,000. The plot shows a significant increase in cases starting in late August, peaking in early September at approximately 100,000 cases. This is followed by a period of fluctuation with a major peak in late October at approximately 80,000 cases. A second, smaller peak occurs in late February at approximately 20,000 cases, followed by a decline and then a slight increase in April. Two vertical dashed red lines mark the dates of the first and second waves.

The figure is a line plot showing the daily number of COVID-19 cases in the Netherlands. The x-axis represents time, with labels for 'Oct', 'Jan', and 'Apr'. The y-axis represents the number of cases, with a grid but no numerical labels. The data is plotted as a blue line with circular markers at each data point. There are two vertical dashed red lines: one at 2020-04-17 and another at 2020-05-01. The plot shows a very high peak in early April 2020, followed by a sharp decline. The number of cases remains relatively low and stable until late March 2021, when there is a smaller peak, followed by a decline and then a slight increase towards the end of the period shown.
