The scatter plot displays the daily death toll from COVID-19 in the United States from July to April. The y-axis represents the number of deaths, with a scale where the top tick mark corresponds to 100,000. The x-axis shows the progression of time, with labels for July, October, January, and April. The data shows two major waves of deaths: one in late July/early August peaking near 100,000 deaths per day, and another in late March/early April peaking near 10,000 deaths per day. There are also two isolated points of low death counts in late October and late March. Vertical red dashed lines are positioned at approximately September 15 and November 15, with a solid grey line at October 1.

The scatter plot displays the number of deaths over time. The x-axis represents time, with labels for Jul, Oct, Jan, and Apr. The y-axis represents the number of deaths, with tick marks but no numerical labels. The data points are black dots. There are two clusters of high death counts in late July and late August. There are two vertical dashed red lines, one around late September and one around late October. There are two low death count points in late November and late March.
