Figure 1 is a scatter plot showing the time series of the difference between the estimated and true values of the parameter α . The y-axis ranges from -0.050 to 0.050. The x-axis shows months from October to April. Two vertical dashed red lines are drawn at approximately October 1st and November 1st. The data points are clustered around zero, with a slight increase in variance after the first dashed line.

Scatter plot showing monthly mean precipitation (mm) for the period 1979-2019. The y-axis represents precipitation in mm, ranging from 28 to 33. The x-axis represents months, with labels for Oct, Jan, and Apr. A red dashed vertical line is positioned at approximately October 1980. The data points are black dots. Most points are at 33 mm, with a few at 31.4 mm and 28.7 mm.

The graph displays the daily number of COVID-19 cases in the Netherlands. The y-axis is labeled 'Number of cases' and ranges from 0 to 20. The x-axis shows time from March 2020 to April 2021, with major ticks for Oct, Jan, and Apr. Two vertical dashed red lines are present: one at approximately March 15, 2020, and another at approximately March 15, 2021. The data shows a peak in early March 2020 (around 15 cases), a sharp drop to near zero in late March 2020, and a subsequent period of low case counts with some fluctuations. A major spike occurs in late March 2021, reaching over 20 cases, followed by a decline and then a period of relative stability with minor fluctuations.
