B530-A-% rCV

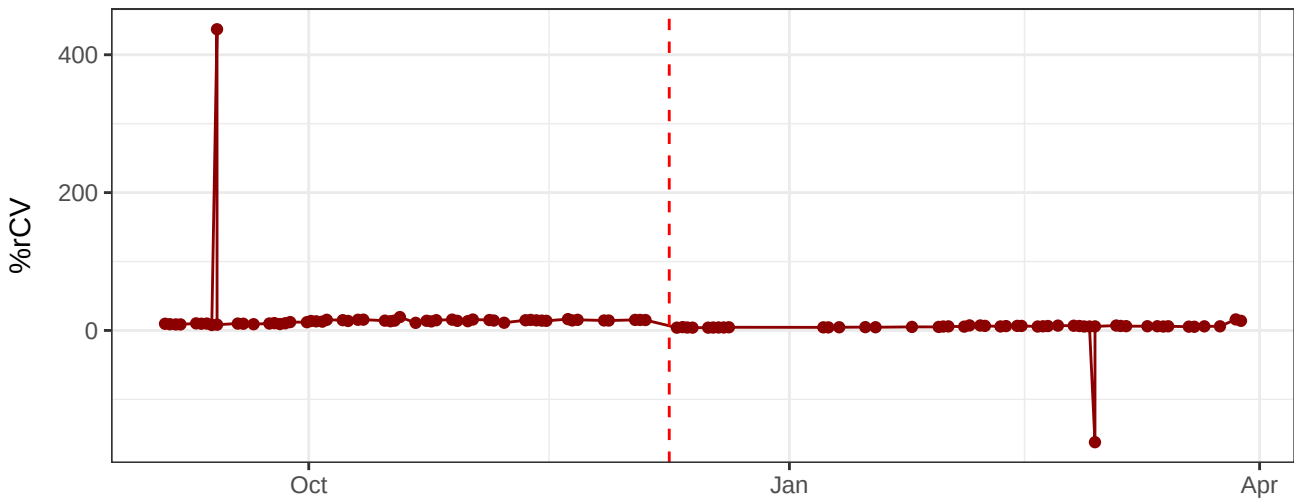

The graph illustrates the daily reported COVID-19 cases in the Netherlands. The data shows a period of high volatility and a significant peak in late September, followed by a period of relative stability and lower case counts after the implementation of the lockdown in late November. A small resurgence is visible in late March.

The graph displays the daily count of COVID-19 cases in the United States. The data begins in late December, indicated by a vertical dashed red line. There is a prominent peak in early January, where cases surge to approximately 95,000. Following this peak, the number of cases drops sharply and remains relatively stable, fluctuating between 10,000 and 20,000 cases per day through April. The overall trend shows a high initial peak followed by a period of lower, more stable case counts.

The graph displays the daily number of COVID-19 cases in the Netherlands. The y-axis is labeled 'Number of cases' and ranges from 0 to 20. The x-axis shows months from September to April. A vertical dashed red line is positioned at the end of November, indicating the start of the second wave. The data shows a first wave peaking in late November, followed by a decline and then a second, much larger wave peaking in early January.
