B530-A-% rCV

The graph displays the daily count of COVID-19 cases in the United States. The data begins in late October with a low number of cases. There is a period of rapid growth through November and December, reaching a peak of nearly 100,000 cases in early January. This is followed by a significant drop in late January, after which the case counts remain low, with a minor spike in late February, before stabilizing again in April.

The graph displays the daily number of COVID-19 cases in the United States. The y-axis is labeled 'Number of cases' and ranges from 0 to 100,000 in increments of 20,000. The x-axis shows the timeline from October 2020 to April 2021. A red dashed vertical line is positioned at the beginning of December 2020, indicating the start of the vaccination campaign. Before this line, the number of cases fluctuates significantly, with a major peak reaching nearly 100,000 in late November/early December 2020. After the vaccination campaign begins, the number of cases drops sharply and remains at a much lower level, generally below 20,000, with a notable spike in late March/early April 2021.

The graph displays the daily count of COVID-19 cases in the United States. The y-axis is labeled 'Number of cases' and ranges from 0 to 100,000 in increments of 20,000. The x-axis is labeled 'Date' and shows months from Oct to Apr. A red dashed vertical line is positioned at approximately October 28th. The data series begins at this point with a value of about 10,000 cases. It rises sharply to a peak of nearly 100,000 cases in early November, then drops precipitously to around 10,000 cases by mid-November. The data continues with several smaller fluctuations, including a notable peak of about 40,000 cases in late December, before settling into a period of relative stability between 10,000 and 20,000 cases from January through April.

The graph displays the daily number of COVID-19 cases in the Netherlands from October to April. The y-axis represents the number of cases, ranging from 0 to 15. The x-axis represents time, with labels for October, January, and April. A red dashed vertical line is positioned at the end of November, indicating the start of the second wave. The first wave peaks in late November at approximately 12 cases. The second wave is significantly larger, peaking in late March at 15 cases. The data shows a clear pattern of waves, with the second wave being much more intense than the first.

The graph displays the daily count of COVID-19 cases in the United States. The y-axis is on a logarithmic scale, with major ticks at 100,000 and 1,000,000. The x-axis spans from October to April. A vertical dashed red line is positioned at the end of December. The data shows a significant peak in early January, exceeding 1,000,000 cases, followed by a period of relative stability and then a slight upward trend towards the end of the period shown.

The graph displays the daily count of COVID-19 cases in the United States. The y-axis is labeled with values 0, 10, 15, and 20. The x-axis is labeled with months: Oct, Jan, and Apr. A red dashed vertical line is positioned at approximately March 11, 2020. The data shows a period of low case counts from October 2020 through early 2021, followed by a sharp increase in cases starting around March 2021, peaking at over 20 cases in early April 2021, and then declining back to low levels by late April 2021.
