The graph displays the daily number of COVID-19 cases in the United States from October to April. The y-axis represents the number of cases, and the x-axis represents time. A blue line with circular markers shows the daily case counts. A vertical dashed red line marks the date of the first case in Washington state (March 15, 2020). The graph shows a significant peak in cases in late March/early April, followed by a sharp decline and a period of low activity.

The graph displays the daily number of COVID-19 cases in the United States from October to April. The y-axis represents the number of cases, and the x-axis represents time. A vertical dashed red line marks the start of the 'lockdown' period in late October. The graph shows a significant increase in cases during the lockdown, peaking in early April, followed by a sharp decline and a subsequent rise in late April.

The graph displays the daily count of COVID-19 cases in the United States. The y-axis is logarithmic, with major ticks at 100,000 and 1,000,000. The x-axis spans from October to April. A red dashed vertical line is positioned at the beginning of the data series in early November. The data shows a period of fluctuation between approximately 100,000 and 300,000 cases from November to February. In early March, there is a dramatic spike, with cases exceeding 1,000,000. Following this peak, the number of cases declines sharply, returning to the 100,000 range by April.

The graph displays the daily count of COVID-19 cases in the United States. The data shows a period of increasing cases from October through late December, peaking at over 20 cases. After the peak, there is a sharp decline, and the number of cases remains relatively low and stable from January through April. A vertical dashed red line marks the transition point around November 1st.
